The sequence contained an oilgo-dT track that was present in the
Oligonic ONA and therefore this may represent a bonafide poly A
tail: The sequence tag present in the clNA between the NotI site
and the oligo-dT track served to identify it as a clone from the
normalized testis library cDNA library Preparation: M.B. Soares Iab
Clone distribution: clones will be available through Research
Seq primer: MIS Forward
POLIXA-Yes.

This sequence represents a breast specific gene (BSG) clone. The BSG sequences are also referred to as breast specific markers (BSM). The invention relates to methods for diagnosing, monitoring, staging, imaging and treating breast cancer (BC). The methods comprise measuring the levels of BSG products in cells, tissues or body fluids of the patient and comparing the measured levels of BSG, with BSG levels of a normal human control. An antibody against the BSG sequences can be labelied and used for imaging BC in a patient. The antibody can be conjugated to a cytotoxic agent, and used for treating BC in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         241 TGGTATCAGAATTCCTACCACAAGCTTTCCCATGTGGAGCAGGCCCCCCATGGTGCTGGT 300

This sequence represents a cDNR of the invention, and is designated cane No. 32. This sequence encodes a human secreted protein, and is expressed primarily in endometrial tumour.

Expressed primarily in endometrial tumour.

Corresponding secreted to the invention and their corresponding secreted protein by a sequences of the invention and their corresponding secreted polymetrides are useful for preventing, treating or ameliorating medical conditions.

Correlation and protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polymetrides in a sample or by determining the presence of mutations in the DNR sequences. Sample or by determining the presence of mutations in the DNR sequences. Secretic uses are described for each of the DNR sequences and the encoded proteins, based on which tissues they are most highly expressed in, and proteins, based on which tissues they are most highly expressed in, and citized developing products for the diagnosis or treatment of cancer chumours, neurological disorders, leukaemiss, diseases of the immune system citization and Albs: the polypeptides are also useful for identifying the contract of the polypeptides are also useful for identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a cDNR of the invention, and is designated concerns. This sequence encodes a human secreted protein, and is expressed primarily in endometrial tumour. Concerns the protein and is expressed primarily in endometrial tumour. Concerns the plan sequences of the invention and their corresponding secreted protein by sequences of the invention and their corresponding secreted colling to an endometrial protein or gene therapy. Also pathological conditions concerns by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the DNR sequences. Specific uses are described for each of the DNR sequences and the encoded corporate products for the diagnosis of treatment of cancer include developing products for the diagnosis or treatment of cancer tumours, neurological disorders, developmental abnormalities and foetal disorders, allowables, diseases of the immune system cliniding allorides or asthma, hepatic disease, Alzheimer's and consistent consistent consistent consistent and AIDS. The polypeptides are also useful for identifying the consistence of the polypeptides are also useful for identifying the consistence of the polypeptides are also useful for identifying the consistence of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fong S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are cost-cord from systemic lupus erythematocisns, rhemanatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic vasculitis, sarcoidosis, autocimmune hemolytic anaemia, autocimmune thrombocytopeania, thyroiditis, diabetes mellitus, immune-mediated remal disease, demyelinating diseases, inflammatory bowel disease, gluten-sensitive enteropathy and whipple's disease, computed minune-mediated skin diseases, allegic diseases, inflammatory bowel disease, gluten-sensitive enteropathy and whipple's disease, immunological diseases of the langer of the central and practical and printed and praft-versus-bost-disease.

CC AACG8397 to AACS857 perpesent PoR primers and hybridisation probes used in the isolation of human PRO sequences. AACS879 to AACS847 represent human PRO polymnological disease and profess the control control and praft-versus-incr-disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ashkenazi AJ, Baker KP, Goddard A, Gurney AL, Hebert C, Henzel W; Kabakoff RC, Lu Y, Pan J, Pennica D, Shelton DL, Smith V; Stewart TA, Tumas D, Watanabe CK, Wood WI, Yan M;

AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential perital cor small nolecule inhibitors of the relevant receptor/ligatide or small nolecule inhibitors of the relevant encogency/ligatid interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmacentical and diagnostic agents. AAA37145 to AAA37330 represent pCR primers and hybridatation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                         New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CCICCICCGAGAGICCCIIGCGCIGCACCAAITICIIAAAITCIICCAGGGCCICCCGGI 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rhemmatoid arthritis, angina, myocardial infarctions, thromobphlebitis, lymphangitis, tunnitia angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; angiogenesis; cardiant; cytostatic; antiangiogenic; hypotensive;

Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthms; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; Ss.
e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atheroscierosis, hypertension, arterial restenosis, rhemancoid arthritis, andriam, mycoardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polymoiceotides have applications in nolecular blotogy, including use as hybridisation probes, and in chromosome and gene mapping. Rables259 to ABL88267 represent primers and probes used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                              61 GGGTAGGTCCAGGTGCTCCGGGCTCTGTGTGTGGTAGGGTGGGGCTCTGGAGGTGCAG 120

The PRO proteins and polynucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ď
                                                                                                                                                         The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPID-gamma (short form). OBPs provide long-term retention (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc. OBP polypeptides are used as binding proteins (perfumes, deodorants etc.) as competitive compounds as competitive compositions (aponists or antagonists) of cellular lipocalcin receptors; inhibitors (aponists or antagonists) of cellular lipocalcin receptors; concert specific antibodies for diagnosis of allergy, asthma or cancer; commeties or disinfectant compositions; to screen compounds, especially comments or flavours, e.g. human pheromones, for binding to OBP, also in analysis of complex perfume mixtures; to solubilise lipophilic compounds; or treating hyperlipidemia or obesity, or to supplement non-maternal anily when combined with nutritional fatty acids, as food additives; as a conflayed release) but also for delayed release) but also for delayed across the placental barrier (e.g. for detoxification of the foetus); as a marker of pregnancy or contagnosing deducing an ample of the amniotic membrane); and as antiallergic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.

The present sequence encodes a human odorant binding polypeptide (OBP), costinated OBFID-alpha. OBPS provide long-term retention (gradual designated OBFID-alpha. OBPS provide long-term retention (gradual compounds, so prolong the hold of perfumes, relates) of lipophilito compounds so prolong the hold of perfumes, competitise to. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors for specific antibodies for diagnosis of allergy, asthma or cancer; for specific antibodies for diagnosis of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, controlling volatilisation of an odorant, specifically in perfumes, compounds, especially concounts or flavours. e.g. human pheromones, for binding to OBP, also in controlling when compounds, or obesity, or to supplement non-maternal for treating hyperlipidema or obesity, or to supplement non-maternal antibute or transporter of pharmaceuticals, especially anticancer agents (providing compounds release) but also for delivery across the placental barrier (e.g. for decoilation) of the foetus); as a marker of pregnancy or contained archifolds, repeated and present of pregnancy or contained archifolds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       193 GTCCCTTGCGCTGCACCAATTTCTTAAATTCTTCCAGGGCCTCCCGGTTGGTATCAGAAT 252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TCTACCCACAGAGCTTCCCATGTGGAGCAGGCCCCCGTGGTGCTGGTCTTTGCAGTAA 312

The present sequence encodes a human odorant binding polypeptide (OBP), designated OBFIra-alpha. OBFs provide long-term retention (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes
                                                                                                                                                                                                                                                                                                                            253 TCCTACCCACAAGCTTTCCCATGTGGAGCAGGCCCCCATGGTGCTGGTCTTTGCAGTAAA 312

OBPs provide long-term retention designated OBPID-beta (long form). OBPs provide long-term retention gradual release) of lipophilio compounds, so prolong the 'hold' of perfames, deodorants etc. OBP POLYPEPTIGES are unsed as binding proteins for hydrophobic ligands (particularly odorants); as competitive controlling volatilisation of an odorant, specifically in perfumes, for centrolling volatilisation of an odorant, specifically in perfumes, cosmetics or disinfectant compositions; to screen compounds, especially analysis of complex perfume mixtures; to screen compounds, especially analysis of complex perfume mixtures; to solubilise lipophilic compounds; or treating hyperlipidemia or obesity, or to supplement non-maternal for transporter of pharmaceuticals, especially anticancer agents (providing current compounds) but also for deliyery across the placental barrier (e.g. for detaxification of the foetus); as a marker of pregnancy or computational fatty and as a marker of pregnancy correct contains an analysis of contains and as a marker of pregnancy or contains an antiallergic agents.
                                                                                                                                                                                                                                                                                                                              odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes

deodorants etc.. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors (agonists or antagonists) of cellular lippoaloin receptors; to detect specific antibodies for diagnosis of allergy, asthma or cancer; for specific antibodies for diagnosis of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in partimes, constituent of disinfectant compositions; to screen compounds, especially codorants or flavours, e.g. human pheromones, for binding to OBP, also in the treating hyperlipidemia or obesity, or to supplement non-maternal for treating hyperlipidemia or obesity, or to supplement non-maternal can mix when combined with nutritional fatty acids, as food additives; as a transporter of pharmaceuticals, especially anticenter agents (providing diagred release) but also for delivery across the placental barrier delayed release) but also for delivery across the placental barrier of e.g. for detoxification of the foctus); as a marker of pregnancy or contain particular of the foctus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /lab.nost="Data" batton with a modified polylinker; Site_1; Not I: Site_2: Eco RI; Equal amounts of plasmid DNW from three normalized libraries (fetal lung NBHL19W, testis NHF, and B-cell libraries (fetal lung NBHL19W, testis NHF, and B-cell NCI CGAP GCB1) were mixed, and ss circles were made in virto. Pollowing HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR: amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of 1. I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento soares and M. Fatima Bonaldo. "
